Independent Gas Protection Verification Services Warehouse Development

A verification plan was provided following consultation with the key contractors and discussion on changes to method statements to protect the gas membrane during laser screed operations.

GGs were commissioned to prepare a verification plan and conduct independent verification in line with Ciria C735 for a new warehouse on behalf of a main contractor.

The perimeter and complex detailing around service duct clusters and stanchions was fully verified and documented.

Full time supervision was provided and detailed reporting was submitted to allow legal completion and handover of the warehouse.
